USE ONLY FOR FILING A PROVISIONAL APPLICATION FOR PATENT

This collection of information is required by 37 CFR 1.51. The information is used by the public to file (and by the PTO to process) a provisional application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 8 hours to complete, including gathering, preparing, and submitting the complete provisional application to the PTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, Washington, D.C. 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Box Provisional Application, Assistant Commissioner for Patents, Washington, D.C. 20231.

150916359106 041703

EXPRESS MAIL NO. EU 982359106 US

DATE OF DEPOSIT: April 17, 2003

The Provisional Application for Patent Cover Sheet and the following thirteen (13) pages are being deposited with the U.S. Postal Service Express Mail Post Office to Addressee Service under 37 CFR §1.10 on the date indicated above and is addressed to: BOX PROVISIONAL PATENT APPLICATION, Commissioner for Patents, Washington, D.C. 20231

EXTENDER TOOL

INVENTOR: Brock Wayne Watson

The extender tool operates essentially the same as a single stage hydraulic cylinder. When pressure is applied to the inside, force is applied to the piston or plunger that will cause the lower end of the tool to move away from the upper end of the tool. This will be used to push the packer, the 10.4 OD cone, and the 11.100 OD cone outside the casing just prior to initial expansion of the casing. We had these tools inside the casing so they would be protected while the casing was being run down-hole but they need to be outside the casing to begin the expansion process. The upper end of the tool has a device that will form a positive lock to an adapter that is part of the casing string. We use this casing lock to carry the weight of the casing as we move downhole. When the actuator gets to the bottom of its stroke, it will shear pins and pull the prop out from under the dogs so that the casing will be released from the casing lock. The actuator remains in the tool string but it does not contribute to the expansion process after this point in the process.

The cup sub assembly is a simple device that seals against the casing. The cups are oriented such that they will seal pressure from below. After the packer has been set in the expansion process, it is possible to expand additional casing using the hydraulic actuator. However, it is more desirable to use a more conventional expansion process because it is faster. The conventional process consists of simply pumping fluid below the cone thus causing it to move upwards. The conventional cone is solid so it forms a necessary seal against the casing, however, since the expandable cone does not form a seal, a packer cup must be used to form the seal. The packer cup mandrel forms this seal.
